

Announcements

- ▶ Homework
 - ▶ Homework 2 has been posted!
 - ▶ I may well still be working on getting through grading all your HW1. Hopefully by the end of today all feedback will be posted
 - ▶ If you are still working on HW1, try to get it in soon! Late days/hours are burning away!
- ▶ Remember that tutors are available Monday and Thursday nights, from 7-10pm
- ▶ Polling: `rembold-class.ddns.net`

Review Question

What will the output of the below code be upon completion?

```
x = 7
y = 0
while x >= 0:
    y = y + x
    x = x - 2
print(y)
```

- A) 15
- B) 16
- C) 28
- D) Code will not complete (infinite loop)

Lost Woods Examples

```
*****
*****
      :(
*****
*****
Go (L)eft or (R)ight?
```

```
*****      *****
*****      *****
              :)
*****      *****
*****      *****
Go (N)orth, (S)outh,
(E)ast, or (W)est?
```

Nesting Loops

- ▶ You are allowed to nest loops, and in many cases might want to
- ▶ Realize that one loop must finish **before** the next advances one iteration!
 - ▶ At which point the inner loop would run in its entirety again

```
week = 1
day = 1
```

```
while week <= 52:
    while day <= 3:
        if day == 1:
            print('Monday')
        elif day == 2:
            print('Wednesday')
        elif day == 3:
            print('Friday')
```

```
        day = day + 1
    week = week + 1
```

Taking a break

- ▶ Sometimes it can be useful to exit a loop without checking the initial test
 - ▶ Maybe you have multiple conditions that could stop the loop
 - ▶ Maybe you have a special condition that when certain requirements are met the loop ends
- ▶ The **break** statement will force an immediate exit from whatever loop it happens to be in

```
x = 1
while True:
    print(x)
    x = x + 1
    if x > 10:
        break
```

Understanding Check

What would be the *last* number printed by the below code?

```
x = 1
while x < 10:
    y = 10
    while y > x:
        if y % 3 == 0:
            break
        print(x*y)
        y = y - 2
    x = x + 1
```

A) 90

B) 60

C) 56

D) 25

Dissecting Strings

- ▶ Recall that strings are a non-scalar object
 - ▶ Made up of smaller pieces, **characters** in the case of strings
- ▶ Each character has an “address” within the string where it lives, called its **index**.

"Spaghetti"

Dissecting Strings

- ▶ Recall that strings are a non-scalar object
 - ▶ Made up of smaller pieces, **characters** in the case of strings
- ▶ Each character has an “address” within the string where it lives, called its **index**.

"Spaghetti"

1 2 3 4 5 6 7 8 9

Dissecting Strings

- ▶ Recall that strings are a non-scalar object
 - ▶ Made up of smaller pieces, **characters** in the case of strings
- ▶ Each character has an “address” within the string where it lives, called its **index**.

"Spaghetti"

1 2 3 4 5 6 7 8 9

Start at 0!

Counting (and indexing) in Python always starts with 0!! This is easy to forget!

Dissecting Strings

- ▶ Recall that strings are a non-scalar object
 - ▶ Made up of smaller pieces, **characters** in the case of strings
- ▶ Each character has an “address” within the string where it lives, called its **index**.

"Spaghetti"

1	2	3	4	5	6	7	8	9
0	1	2	3	4	5	6	7	8

Start at 0!

Counting (and indexing) in Python always starts with 0!! This is easy to forget!

Dissecting Strings

- ▶ Recall that strings are a non-scalar object
 - ▶ Made up of smaller pieces, **characters** in the case of strings
- ▶ Each character has an “address” within the string where it lives, called its **index**.

"Spaghetti"

1	2	3	4	5	6	7	8	9
0	1	2	3	4	5	6	7	8
-9	-8	-7	-6	-5	-4	-3	-2	-1

Start at 0!

Counting (and indexing) in Python always starts with 0!! This is easy to forget!

Indexing Notation

- ▶ To get the character at a certain address or index, use *square brackets*

```
x = "Spaghetti"
```

```
0 1 2 3 4 5 6 7 8
```

- ▶ `x[0]` = "S"
- ▶ `x[4]` = "h"
- ▶ `x[-1]` = "i"
- ▶ `x[1]` = "p"

The Slicing

- ▶ Frequently, you want more than a single character
- ▶ Would be useful to give a start and stop point to extract a “sub”-string
 - ▶ Possible through **slicing**!
 - ▶ Notation is: `var[<start>:<stop>]`
 - ▶ Could be read as: “Get me all the characters from the <start> up to the <stop> *but not including the stop*”

`x = "Spaghetti"`

0 1 2 3 4 5 6 7 8

- ▶ `x[0:3] = "Spa"`
- ▶ `x[4:] = "hetti"`

and the Dicing

- ▶ Slices are a form of shorthand for looping through a string and pulling out the value between two indices
- ▶ But what if you don't want *every* character between the two endpoints?
 - ▶ Only want every other character? Or every 10th character?
- ▶ Can achieve by adding one more term to our slices:

`x[<start>:<stop>:<step>]`

- ▶ A <step> of 2 would take every other character
- ▶ Default is a <step> of 1
- ▶ A *negative* step will go backwards from stop to start!
